

SOFTWARE DEVELOPMENT

Pre-Final Testing Documentation

Required Submission Checklist & Guidelines

Due Date:
Wed, May 13, 2026

Submit all documents as a compiled ZIP, Named the ZIP file with your group members fullname

Course	Software Development / Software Engineering
Document	Pre-Final Testing Documentation Requirements
Prepared by	
Academic Year	2025–2026 Second Semester
Submission Deadline	Wed, May 13, 2026 — 11:59 PM

1. Purpose of This Document

This document defines all the testing deliverables that student groups are required to produce and submit as part of their Pre-Final output in the Software Development course. These documents demonstrate that the student team has properly planned, executed, and documented the testing phase of their software project — following industry-standard practices based on the IEEE 829 Testing Standard and widely-adopted software quality frameworks.

Each testing document listed in this guide serves a specific purpose in the software quality assurance process. Students are expected to tailor each document to their specific project, not simply copy a template. Incomplete, generic, or unrelated submissions will be returned for revision.

NOTE: This submission covers the Testing Phase only. System design documents, source code, and deployment artifacts are covered under separate submission guidelines.

2. Required Documents — At a Glance

The following table summarizes all nine (9) required testing documents, their purpose, and their submission format.

#	Document	Purpose	Format	Min. Pages
1	Test Plan	Defines overall testing strategy, scope, and schedule	.docx / .pdf	5–8
2	Test Cases Document	Step-by-step test cases with expected results	.xlsx / .docx	3–5
3	Unit Test Report	Results of unit-level testing per module/function	.docx / .pdf	2–4
4	Integration Test Report	Verifies that modules work correctly together	.docx / .pdf	2–4
5	System Test Report	End-to-end validation of the complete system	.docx / .pdf	3–5
6	UAT Plan & Report	User acceptance testing plan, execution, and results	.docx / .pdf	5–8
7	Defect / Bug Report Log	Tracked list of all defects found, with status	.xlsx / .docx	1–2
8	Regression Test Report	Confirms fixes did not break existing features	.docx / .pdf	2–3
9	Test Summary Report	Overall testing outcome, metrics, and sign-off	.docx / .pdf	3–5

3. Detailed Document Descriptions

The following sections describe each required document in detail — what it must contain, why it is important, and common mistakes to avoid.

Document 1 — Test Plan

The Test Plan is the master document that governs the entire testing effort. It is written before testing begins and describes how, what, when, and by whom testing will be conducted. It follows the IEEE 829-1998 standard.

Required Contents:

- Test Plan Identifier — unique document ID, version number, date, author
- Introduction — project overview and purpose of the plan
- Scope — what is being tested and what is explicitly excluded
- Test Items — list of modules, features, or components to be tested
- Features to Be Tested — with assigned risk level (High / Medium / Low)
- Features Not to Be Tested — with justification for each exclusion
- Approach / Strategy — testing methods, tools, and techniques to be used
- Item Pass/Fail Criteria — how a test case is determined to pass or fail
- Test Deliverables — list of all documents to be produced
- Test Tasks and Schedule — timeline tied to development milestones
- Environmental Needs — hardware, software, and network requirements
- Responsibilities — named person responsible for each testing activity
- Risks and Contingencies
- Approvals — sign-off section

NOTE: The Test Plan must reference your actual project. Generic or copy-pasted plans with placeholder text will not be accepted.

Document 2 — Test Cases Document

A detailed catalogue of all individual test cases. Each test case is a specific scenario that verifies one aspect of the system's behavior. This is typically submitted as a spreadsheet with one row per test case.

Each Test Case Must Include:

- Test Case ID — unique identifier (e.g., TC-001, TC-002)
- Module / Feature being tested
- Test Case Title — brief description
- Preconditions — what must be true before executing the test
- Test Steps — numbered, step-by-step actions to perform

- Test Data — exact inputs to use
- Expected Result — what should happen if the system is working correctly
- Actual Result — filled in during execution
- Pass / Fail — verdict recorded by the tester
- Priority — Critical / High / Medium / Low
- Tester Name and Date Executed

Minimum of 15 test cases required covering all major modules of your system.

Document 3 — Unit Test Report

Unit testing verifies that individual functions, methods, or components work correctly in isolation. This report documents the results of all unit tests performed on the codebase.

Required Contents:

- Introduction — scope of unit testing for the project
- List of modules / functions tested
- Test method used (manual, automated framework, etc.)
- For each unit tested: function name, test input, expected output, actual output, pass/fail
- Summary statistics — total tests, passed, failed, pass rate percentage
- List of defects found during unit testing with reference to Defect Log
- Conclusion — readiness to proceed to integration testing

NOTE: If your team used a testing framework (e.g., PHPUnit, Jest, JUnit, PyTest), include screenshots of the test runner output.

Document 4 — Integration Test Report

Integration testing verifies that separately developed modules work together as expected when combined. This is performed after unit testing is complete.

Required Contents:

- Introduction — which modules are being integrated and tested together
- Integration strategy used (top-down, bottom-up, big-bang, or sandwich)
- Integration test scenarios — describe each combination tested
- Test results — for each integration scenario: inputs, expected behavior, actual behavior, pass/fail
- Interface defects found — any data passing issues between modules
- Summary and readiness for system testing

Document 5 — System Test Report

System testing evaluates the complete, integrated system against its specified requirements. It is conducted by the development test group (not end users) and covers both functional and non-functional requirements.

Required Contents:

- System test scope — all functional requirements being validated
- Test environment setup details
- Functional test results mapped to each requirement

- Non-functional testing results (at least two of the following):
 - Performance — response times under normal load
 - Security — login protection, access control validation
 - Usability — navigation, error messages, user interface
 - Compatibility — browser/device compatibility tested
- Defects identified during system testing with severity
- Overall pass/fail rate and system readiness assessment

Document 6 — UAT Plan & Report

User Acceptance Testing (UAT) is performed by the intended end users (clients, classmates acting as users, or faculty) to confirm the system meets their actual business needs. This is the final testing phase before deployment.

UAT Plan Must Include:

- Project overview and UAT scope
- UAT objectives — primary and secondary
- Test methodology and phases
- UAT environment details
- Roles and responsibilities — who performs which tests
- UAT test cases — at least 5 business-scenario based test cases
- Defect prioritization scheme (Critical / High / Low)
- UAT schedule with dates
- Entry and exit criteria
- Assumptions and risks

UAT Report Must Include:

- Execution results for all UAT test cases
- Defects found during UAT with severity and status
- User feedback and observations
- UAT sign-off section — to be signed by the end user/evaluator

NOTE: UAT must be performed with actual users — not the developers. Document who performed the UAT (name and role). The sign-off section must be filled out and signed.

Document 7 — Defect / Bug Report Log

The Defect Log is a running record of every defect (bug) found across all testing phases. It is typically maintained as a spreadsheet and updated throughout the testing lifecycle.

Each Defect Entry Must Include:

- Defect ID — unique identifier (e.g., DEF-001)
- Title — brief, descriptive name for the defect
- Module / Feature affected
- Severity — Critical / High / Medium / Low
- Priority — the order in which it should be fixed
- Testing phase in which it was found (Unit / Integration / System / UAT)
- Steps to reproduce — numbered, specific steps
- Expected result vs. Actual result

- Status — Open / In Progress / Fixed / Verified / Closed / Deferred
- Assigned to — developer responsible for fixing
- Date reported and date resolved
- Screenshots or evidence (attached or referenced)

Minimum of 3 defects required across all testing phases.

Document 8 — Regression Test Report

Regression testing confirms that defects which were fixed have not reintroduced problems or broken other parts of the system. It is performed after each round of bug fixes.

Required Contents:

- Introduction — which fixes triggered this regression cycle
- Regression scope — which test cases were re-executed
- Regression results table — test case ID, previous result, new result, pass/fail
- New defects uncovered during regression (if any)
- Summary — confirmation that previously passing tests still pass

At minimum, all test cases related to fixed defects must be re-executed and documented.

NOTE: Regression testing must be done after at least one round of defect fixes. If no defects were fixed, explain why regression testing was not applicable.

Document 9 — Test Summary Report

The Test Summary Report is the final document that wraps up the entire testing phase. It provides a complete picture of the testing effort, the quality of the software, and a recommendation on readiness for deployment.

Required Contents:

- Executive Summary — one-paragraph overview of testing outcomes
- Test scope and objectives — restated from the Test Plan
- Testing metrics:
 - Total test cases planned vs. executed
 - Pass rate percentage per testing phase
 - Total defects found, fixed, deferred, and remaining
 - Defect severity breakdown (Critical / High / Medium / Low)
- Phase-by-phase summary (Unit → Integration → System → UAT)
- Outstanding issues — any open defects and justification for deferral
- Lessons learned — what worked, what could be improved
- Recommendation — Approve for deployment / Conditional approval / Not ready
- Sign-off section — signatures from tester, project lead, and instructor

NOTE: The Test Summary Report must be the LAST document completed, after all testing phases are done. It synthesizes all previous test reports into one executive-level document.

4. Testing Phase Flow

The diagram below shows the sequence in which documents must be produced. Each phase builds on the previous one.

5. Submission Checklist

Before submitting on Tuesday, May 13, 2026, each group must verify the following. Use this as your final check before uploading.

✓	Item	Status
☐	Doc 1 — Test Plan is complete with all IEEE 829 sections filled out	
☐	Doc 2 — Test Cases Document has at least 15 test cases with all fields	
☐	Doc 3 — Unit Test Report covers all major modules with actual results	
☐	Doc 4 — Integration Test Report documents module integration scenarios	
☐	Doc 5 — System Test Report covers functional and non-functional requirements	
☐	Doc 6 — UAT Plan is written with real user scenarios (not developer-written)	
☐	Doc 6 — UAT Report includes execution results and sign-off by actual users	
☐	Doc 7 — Defect Log has at least 8 entries with all required fields	
☐	Doc 7 — All defects have screenshots or evidence attached or referenced	
☐	Doc 8 — Regression Test Report covers re-testing of fixed defects	
☐	Doc 9 — Test Summary Report includes metrics, recommendation, and sign-off	
☐	All documents use your actual project name and data (no placeholder text)	
☐	All documents have consistent version numbers, dates, and group name	
☐	Files are named clearly: "GroupName_Project_Doc1_TestPlan.pdf", etc.	
☐	All files compiled into a single ZIP folder or PDF portfolio	
☐	Submitted via the designated LMS/portal before 11:59 PM on May 13, 2026	

6. File Naming Convention

All submitted files must follow this naming format to ensure proper identification:

Document	File Name Format
Test Plan	[GroupName_Project]_Doc1_TestPlan.pdf
Test Cases	[GroupName_Project]_Doc2_TestCases.xlsx

Document	File Name Format
Unit Test Report	[GroupName_Project]_Doc3_UnitTestReport.pdf
Integration Test Report	[GroupName_Project]_Doc4_IntegrationTestReport.pdf
System Test Report	[GroupName_Project]_Doc5_SystemTestReport.pdf
UAT Plan & Report	[GroupName_Project]_Doc6_UATPlanReport.pdf
Defect Log	[GroupName_Project]_Doc7_DefectLog.xlsx
Regression Test Report	[GroupName_Project]_Doc8_RegressionTestReport.pdf
Test Summary Report	[GroupName_Project]_Doc9_TestSummaryReport.pdf

SUBMISSION DEADLINE**Wed, May 13, 2026 — 11:59 PM***Submit all 7 documents as a compiled ZIP or PDF portfolio via the course portal.*
